

Sliver Care

Final Project Report

Group6 • 22 September 2026

1 The decision

Group6 has decided to stop advancing the venture after the course. The main reason is the team's time and future resource commitments: the team cannot commit to ongoing development, maintenance and user support after the course.^[C01]

The group members are listed in table 1.^[C25]

Table 1: Group6 member roster

Member name	Student number
XINYU LAI	2023362046
ZHENGYUAN QIU	2023362027
MINXUAN LI	2023362005
JINGHAO YU	2023362059
RUI ZHOU	2023362052
YIYANG FENG	2023362038
SHENGWEI HUANG	2023362024
TIANYI LI	2023362026

Method and scope: the local care workflow and checkout use simulated care data and payments. Outreach now uses the team's actual consultations and emails, supported by the supplied feedback summary, chat images and email-list image. Four chat screenshots and one email-list screenshot are selected for concise presentation; they are not the complete outreach archive. Previous course outreach simulations are excluded. The team's decision after the course remains Stop.

The package provides an operating local family-care workflow. Twelve recorded automated functional experiments passed using controlled scenario data, with no external customer participants.^[C02]

The report combines feedback from eight individuals consulted on 20–22 September 2026, ten organisational emails sent on 20 September as confirmed by the team, supplied screenshots, and dated local product experiments. Representative evidence is identified for each displayed example.^[C03]

The next 90 days concern archiving the product and feedback, completing the team review and keeping the project inactive. The new comments help explain what customers may value, but do not establish sustained use, paid demand or reliable connected delivery.

2 Problem and customer

Our initial problem hypothesis is that family members can lose track of who should follow up after a reminder and what happened after contact. The proposed customer is the adult child coordinating care for an independently living parent who can use a simple response interface.^[C04]

The older adult and the family caregiver are intended users. The organising adult child is the proposed buyer. That distinction determines the design: a short response on one side, responsibility and a follow-up record on the other.

Early feedback supports exploring family responsibility and follow-up as a problem. One chat prioritises named responsibility, and another identifies parents living alone, distant children and several relatives sharing care. These qualitative comments do not establish how widespread the need is.^[C05]

The two-phone example demonstrates a possible response and follow-up flow. The new feedback gives initial qualitative support to responsibility and record-keeping. The sample is small, recruitment is not documented, and comments after viewing an introduction are different from observed use.

An appropriate future test, only if the project is reopened, would observe a consenting family completing a specific handover without coaching, then ask for an explicit response to the quoted offer. Completion, confusion and the response would need dates and records. This is a proposed method, not a test already run.

3 The product

A user receives a local browser application, sample care profiles, reminder plans, responsibility records and downloadable reports. It runs through a local server; the original two-phone example and the working household have separate histories.^[C06]

The working sequence is to choose a recipient and responsible family member, start a reminder, record a self-reported response or help request, record a family outcome or handover, and generate a report from those saved actions.^[C07]

The confirmed proposed family prices are Free ¥0, Plus ¥39/month or ¥390/year, Pro 5x ¥79/month or ¥790/year, and Pro 20x ¥99/month or ¥990/year. Annual totals are paid upfront in the proposal; the current offline evaluation costs ¥0.^[C08]

The proposed prices, local capacities and template allowances are compared in table 2.

Table 2: Proposed family plans and local product defaults

Plan	Monthly RMB	Annual RMB	Local capacity	AI templates per cycle
Free	0	0	1 recipient / 1 family role	0
Plus	39	390	2 / 4	20
Pro 5x	79	790	5 / 8	100
Pro 20x	99	990	5 / 8	400

The table capacities are offline product defaults. The Pro options have identical care features; 5x and 20x describe the monthly AI allowance relative to Plus. The assistant generates local templates rather than calling a live model.^[C09]

Checkout is simulated and the actual charge is zero. Failure or cancellation does not activate a plan. A successful local activation enables paid-tier features, while quota exhaustion does not block the core care response.^[C10]

For the cost model, one unit means one active paying family for one month. Its assumed variable cost is ¥18.19 in the base scenario. Actual development hours, staff costs and supplier quotations have not been recorded, so no measured cost to build the first app or serve a real family is claimed.^[C11]

A check-in is a self-report; recording an outcome does not establish clinical safety. This edition has no connected family accounts, real notifications, live payment, medical monitoring or emergency response.

The proposed tiers address different needs. Plus at RMB 39/month supports everyday responsibility, multiple plans and report export. Pro 5x at RMB 79/month adds rota, backups, handovers and adjustable follow-up. Pro 20x at RMB 99/month retains the same Pro care features and adds 300 generations for RMB 20 more per month. One contact conditionally accepts RMB39/month if the service is reliable and used regularly; this does not establish a paid conversion.^[C28]

Plus provides 20 successful local generations per monthly cycle, Pro 5x 100 and Pro 20x 400. All roles and recipients in a household share the counter. Each new successful generation, including regeneration, costs one use; failed, cancelled or invalid requests cost zero. Reading or saving an existing draft and exporting a care report cost zero. Unused allowance does not roll over. Plan changes preserve usage, while a new monthly demo cycle resets it and retains past drafts. Annual totals equal ten monthly fees but do not multiply the monthly allowance.^[C29]

The current local evaluation is free. Cross-device family accounts, remote notifications and live AI remain proposed capabilities, with no launch date under the Stop decision. Proposed live AI uses would include weekly summaries, handover drafts and follow-up lists based on saved records, subject to family review. Current local templates already produce summaries and handover drafts containing open items. Neither a template nor a future model can verify actual medication intake or establish clinical safety.

4 Show the product

The version comparison below uses the earliest retained screenshot available for this report and the current working household. The earlier picture shows one older-adult and family pair. The current view shows saved care items, named responsibility and distinct open and recorded-outcome states.^[C12]

The retained and current interfaces appear side by side in figure 1.

(a) Earlier retained prototype: guided two-phone example. Date of first capture is not established.

(b) Current local MVP: enlarged detail of an open care item, recaptured 20 September 2026. The complete screenshot is source S14.

Figure 1: Earlier retained product example and an enlarged care-item detail from the current local workspace. The full fresh capture is retained as source S14 [14].

The visible changes are summarised in table 3.

Table 3: Changes visible in the retained product artifacts

Visible change	Earlier retained example	Current workspace
Role of screen	Illustrates a response flow	Operates saved care records
Responsibility	Single illustrated family pair	Recipient and responsible-person fields
Output	On-screen event history	Report containing entered outcomes and handover

The verified report file contains the entered follow-up note and a handover, with 2,322 decoded characters and 2,329 UTF-8 bytes. Its content matches the report preview used in the download check.^[C13]

Reproduce the product locally by running `Start.cmd`, opening Care workspace and following the demonstration script. Appendix B includes a report extract and evidence-file locations. No person outside the team appears using the product; no independent usability test is claimed. We cannot verify that the retained picture was the first-ever design.

5 What you tested

On 20 September 2026, the coding assistant ran twelve automated functional experiments against a saved snapshot of the product rules. The evidence records each belief, procedure and result. These are implementation tests, not observations of market demand.^[C14]

The experiment groups and observed outcomes are summarised in table 4.

A reconstructed period-only open-item rule counted zero open reminders after eight days even though one remained unresolved. The current all-date rule counted one and included it in the report. This experiment demonstrates why the reporting window must not hide open work.^[C15]

A reconstructed full replacement reset retained zero outreach fixtures. The current care-only reset retained the one fixture and its unsent request. The fixture was synthetic and never entered the real outreach log.^[C16]

Table 4: Functional experiments, procedures and outcomes

Experiments	Belief and action	Observed result
E01–E02	Complete Free follow-up; activate Plus and inspect the report	Outcome recorded and note included
E03–E04	Exercise checkout failure, cancellation, duplication and annual totals	State preserved; one receipt; 390 / 790 / 990 quotes
E05–E07	Exhaust AI quota; use Pro backup and handover; downgrade	Core response works; responsibility changes; history persists
E08–E09	Age an open reminder eight days, then record an outcome	Open item retained; later outcome counted in its event period
E10	Reset care with synthetic outreach and request fixtures	Both fixture records retained; not written to real browser log
E11–E12	Cross midnight with a rota; tamper with a simulated receipt	Due-date owner selected; invalid charged receipt rejected

These results support retaining all open work and preserving outreach during a care reset. They do not show that real families understand the interface. We also have no recorded timed presentation rehearsal or observed outside-user task completion, and do not substitute automated checks for either.

Fifteen additional automated checks recorded on 20 September 2026 cover nine scenario steps and six allowance contracts. All passed. The examples execute the same local product rules in isolated sample households. These checks supplement the original twelve experiments; they are not customer participants or evidence of willingness to pay.^[C30]

The team-prepared feedback document contains eight bilingual question-and-answer themes, not a response-by-person dataset. It covers willingness to try, responsibility, ease of use, price, free evaluation, privacy, target households and proposed features. Four chat screenshots support selected themes; individual-level percentages cannot be calculated from this material.^[C31]

The outreach questions and observations are summarised in table 5.

Table 5: Questions explored through the outreach

Belief explored	Action and available result	Implication
Families need clear responsibility	Shared product introduction; one chat prioritises named responsibility (S18)	Show responsibility and saved outcomes in the core demonstration
RMB39/month may be acceptable	One chat accepts conditionally on reliability and frequent use (S19)	Keep pricing proposed; reminders alone may not justify it
Connected coordination matters	One chat requests alerts and shared updates (S20)	Retain as proposed capabilities; delivery remains untested
Organisations will engage	Team sent ten invitations; no replies by 22 September (S23)	This channel has produced no response yet; silence does not establish rejection

6 Model and numbers

The revenue hypothesis is an optional subscription paid per family. The model assumes 70% Plus, 20% Pro 5x and 10% Pro 20x; within each plan, 60% pay monthly and 40% annually. Annual revenue is divided by 12 for monthly comparison.^[C17]

The inputs used for the base scenario are listed in table 6.^[C26]

Table 6: Base scenario inputs for one paying family per month

Input	Base assumption
Service, support and AI per paid family / month	¥12.00
Free households funded per paid household	5 at ¥0.50 each
Processing allowance	1% of recognised revenue
Equivalent monthly churn and replacement acquisition	4% and ¥80
Fixed operations per month	¥30,000
Active paying households	800

The calculated monthly revenue per paid family is ¥49.47. Variable cost including replacement acquisition is ¥18.19, leaving contribution of ¥31.27. With ¥30,000 fixed monthly operations, break-even is 960 paid families; at 800 families the monthly result is a loss of ¥4,982.40.^[C18]

For the same calculation, let $\mathcal{P}$ be the set of paid plans, w_k the share of paying families on plan k , M_k its monthly price, A_k its annual total, and α the monthly-billing share. Monthly revenue per paying family is

$$R = \sum_{k \in \mathcal{P}} w_k \left[\alpha M_k + (1 - \alpha) \frac{A_k}{12} \right]. \quad (1)$$

Let s denote service, support and AI cost; r_f the free-family ratio; c_f cost per free family; ϕ the processing fraction; χ churn; and a replacement acquisition cost. Variable cost V and contribution C are

$$V = s + r_f c_f + \phi R + \chi a, \quad C = R - V. \quad (2)$$

For N paying families and fixed monthly operations F , the operating result and break-even family count are

$$\Pi(N) = NC - F, \quad N_{\text{BE}} = \left\lceil \frac{F}{C} \right\rceil \quad (C > 0). \quad (3)$$

Equations (1)–(3) express the approved scenario arithmetic using the inputs in table 6. In particular, $V = 12 + (5 \times 0.50) + (49.4666667 \times 0.01) + (0.04 \times 80)$. Rounding occurs only for display.

Allocating fixed costs over 800 assumed paying families gives a total monthly cost of ¥55.69 per family. The model excludes initial development, launch costs, growth acquisition, financing and taxes. It does not establish the cost or time needed to acquire 800 families.^[C19]

No supplier quote, measured support load, retention observation or sale validates these inputs. The arithmetic works as a scenario, while the business case remains unproven. We therefore use it to identify evidence we lack, rather than as a forecast that supports continuing.

7 Commitment

The team confirms eight individual consultations on 20–22 September 2026 and product-experience invitations emailed to ten organisations on 20 September. Those emails included an MVP demonstration video and product introduction PDF. No organisational reply had been received as of the team update on 22 September.^[C20]

The course outreach results are organised in table 7.

The supplied chats show interest in trying the product, a preference for named responsibility, conditional acceptance of RMB39/month, and requests for automatic notifications and shared updates. The materials contain no completed purchase, deposit, agreed pilot or observed product trial. No-reply institutional contacts remain pending rather than classified as rejections.^[C21]

Table 7: Course outreach stages and commercial interpretation

Activity / evidence	Count / period	Outcome and interpretation
Individual consultations	8; 20–22 Sep 2026	Four chat screenshots plus a thematic summary; no per-person response-rate estimate
Organisation invitations	10; sent 20 Sep 2026	No replies reported as of 22 Sep; six email rows shown
Price feedback	One visible RMB39/month response	Conditional acceptance; reminders alone may feel expensive
Purchase / pilot commitment	No supplied evidence	Stated interest is not a completed sale or trial
Team decision	Stop after the course	Archive feedback; stop due to team time and resource commitments

For the requirement to make at least ten commercial offers, the team reports ten organisational product-experience invitations. The report presents a selected email-list screenshot rather than reproducing all correspondence. The eight individual consultations are recorded separately and are not automatically counted as eight additional commercial offers.^[C22]

The practical lesson is to demonstrate named responsibility and saved follow-up before discussing AI. The conditional price response adds a clear requirement: usefulness depends on reliable delivery and regular household use. The notification request identifies a gap in the current local MVP. The absence of replies after the reported email outreach has yielded no institutional commitment so far.

The email-list preview includes greetings to Taikang Home, Xinrong Linbang and Xiaode Zhi-neng. These examples identify the intended addressee in the message greeting; the screenshot does not independently establish the mailbox’s organisational ownership, delivery or a partnership. All ten institutional contacts remain without a reported reply as of 22 September.^[C33]

Earlier ten-record course simulations, including the four-interested, four-declined and two-pending split, are archived separately. They contribute zero contacts, responses or commitments to this updated actual-outreach account.^[C32]

8 Limitations

The eight consultations provide initial qualitative reactions. Recruitment, participant characteristics, independently usable task performance, repeat use and paid conversion remain unmeasured. The displayed chats are illustrative excerpts, not a quantitative distribution of opinions. Lack of institutional reply does not distinguish unread mail, low priority or lack of interest.

The functional evidence covers controlled local scenarios and a local browser. It does not establish cross-device delivery, real accounts, reliability in service, clinical effects or live billing.^[C23]

The retained prototype screenshot provides a partial development history. We have no measured initial build cost, timed speaking rehearsal, completed customer purchase or agreed pilot. Feedback collection does not resolve live sync, notification reliability, security or service cost. These evidence limits are separate from the team’s main reason for stopping: time and future resource commitments.

The proposed closure and review schedule is set out in table 8.

Table 8: Proposed 90-day closure plan after the course

Period after the course ends	Stop plan	Condition
Days 1–30	Archive the product, evidence, outreach register and final report with their method and source notes	No commercial launch or new promises
Days 31–60	Complete the team review, record unresolved questions and keep the project inactive	No assumed sales, recruitment or development commitment
Days 61–90	Keep the project stopped; no further development or launch is scheduled	No new development, recruitment or launch promises

The course requires one team submission, a report of no more than 20 pages excluding the appendix, and a seven-minute presentation in four prescribed parts. The supplied final instructions do not state a calendar deadline.^[C24]

The 90-day table is a proposed closure and review plan consistent with Stop. It is not evidence that actions have already occurred. Actual Blackboard submission remains a team action.

A Factual claim register

This register covers the report narrative, tables, captions and identities. Actual outreach is documented through team confirmations, the supplied feedback summary and screenshots. Observed screenshot content is separated from unshown details, estimates, model assumptions and proposed actions. Earlier fictional outreach is archived and excluded. No clinical-effect or representative market claims are made.

Claim identifiers in the text link to the entries below. Numbered citations identify the source catalogue in section B.

C01 Owner decision

Group6 has decided to stop advancing the venture after the course. The main reason is the team's time and future resource commitments: the team cannot commit to ongoing development, maintenance and user support after the course.

Basis: [2]. decision and decisionScope

C02 Observed fact

The package provides an operating local family-care workflow. Twelve recorded automated functional experiments passed using controlled scenario data, with no external customer participants.

Basis: [4, 5]. experimentCount, passed, scope and E01–E12

C03 Observed feedback and team confirmation

The report combines feedback from eight individuals consulted on 20–22 September 2026, ten organisational emails sent on 20 September as confirmed by the team, supplied screenshots, and dated local product experiments. Representative evidence is identified for each displayed example.

Basis: [17, 18, 19, 20, 21, 22, 23, 24]. Feedback document, four chat images, email list and team confirmation

C04 Problem hypothesis informed by feedback

Our initial problem hypothesis is that family members can lose track of who should follow up after a reminder and what happened after contact. The proposed customer is the adult child coordinating care for an independently living parent who can use a simple response interface.

Basis: [17, 18, 21]. Problem hypothesis and qualitative comments about responsibility and intended households

C05 Observed feedback and team confirmation

Early feedback supports exploring family responsibility and follow-up as a problem. One chat prioritises named responsibility, and another identifies parents living alone, distant children and several relatives sharing care. These qualitative comments do not establish how widespread the need is.

Basis: [18, 21, 23]. Two supplied chat screenshots and consultation context

C06 Observed fact

A user receives a local browser application, sample care profiles, reminder plans, responsibility records and downloadable reports. It runs through a local server; the original two-phone example and the working household have separate histories.

Basis: [5, 6]. newState, saveSchedule, report; browser workspace observation

C07 Observed fact

The working sequence is to choose a recipient and responsible family member, start a reminder, record a self-reported response or help request, record a family outcome or handover, and generate a report from those saved actions.

Basis: [4]. E01, E02, E06

C08 Observed fact

The confirmed proposed family prices are Free ¥0, Plus ¥39/month or ¥390/year, Pro 5x ¥79/month or ¥790/year, and Pro 20x ¥99/month or ¥990/year. Annual totals are paid upfront in the proposal; the current offline evaluation costs ¥0.

Basis: [2, 5, 4]. Prior owner pricing carried in PLANS; E04 totals. Prices are proposals for a future service.

C09 Observed fact

The table capacities are offline product defaults. The Pro options have identical care features; 5x and 20x describe the monthly AI allowance relative to Plus. The assistant generates local templates rather than calling a live model.

Basis: [5]. PLANS and generate

C10 Observed fact

Checkout is simulated and the actual charge is zero. Failure or cancellation does not activate a plan. A successful local activation enables paid-tier features, while quota exhaustion does not block the core care response.

Basis: [4]. E02–E05

C11 Calculation with unvalidated inputs

For the cost model, one unit means one active paying family for one month. Its assumed variable cost is ¥18.19 in the base scenario. Actual development hours, staff costs and supplier quotations have not been recorded, so no measured cost to build the first app or serve a real family is claimed.

Basis: [10]. assumptions, calculated.variableCost and excluded

C12 Observed fact

The version comparison below uses the earliest retained screenshot available for this report and the current working household. The earlier picture shows one older-adult and family pair. The current view shows saved care items, named responsibility and distinct open and recorded-outcome states.

Basis: [3, 7, 14]. Earlier retained prototype, original workspace capture and fresh full-resolution source S14; the report enlarges the open care-item detail.

C13 Observed fact

The verified report file contains the entered follow-up note and a handover, with 2,322 decoded characters and 2,329 UTF-8 bytes. Its content matches the report preview used in the download check.

Basis: [6, 9]. download observation, character count and SHA-256

C14 Observed fact

On 20 September 2026, the coding assistant ran twelve automated functional experiments against a saved snapshot of the product rules. The evidence records each belief, procedure and result. These are implementation tests, not observations of market demand.

Basis: [4, 12]. recordedAt, executor, results and reproduction script

C15 Observed fact

A reconstructed period-only open-item rule counted zero open reminders after eight days even though one remained unresolved. The current all-date rule counted one and included it in the report. This experiment demonstrates why the reporting window must not hide open work.

Basis: [4]. E08. The rejected rule is explicitly a reconstruction.

C16 Observed fact

A reconstructed full replacement reset retained zero outreach fixtures. The current care-only reset retained the one fixture and its unsent request. The fixture was synthetic and never entered the real outreach log.

Basis: [4]. E10. Reconstructed rejected rule compared with current reset.

C17 Scenario assumption

The revenue hypothesis is an optional subscription paid per family. The model assumes 70% Plus, 20% Pro 5x and 10% Pro 20x; within each plan, 60% pay monthly and 40% annually. Annual revenue is divided by 12 for monthly comparison.

Basis: [10]. assumptions; formula in S12

C18 Calculation with unvalidated inputs

The calculated monthly revenue per paid family is ¥49.47. Variable cost including replacement acquisition is ¥18.19, leaving contribution of ¥31.27. With ¥30,000 fixed monthly operations, break-even is 960 paid families; at 800 families the monthly result is a loss of ¥4,982.40.

Basis: [10]. calculated values

C19 Calculation with unvalidated inputs

Allocating fixed costs over 800 assumed paying families gives a total monthly cost of ¥55.69 per family. The model excludes initial development, launch costs, growth acquisition, financing and taxes. It does not establish the cost or time needed to acquire 800 families.

Basis: [10]. calculated.costIncludingFixedAt800 and excluded

C20 Team-confirmed outreach with selected supporting screenshots

The team confirms eight individual consultations on 20–22 September 2026 and product-experience invitations emailed to ten organisations on 20 September. Those emails included an MVP demonstration video and product introduction PDF. No organisational reply had been received as of the team update on 22 September.

Basis: [22, 23, 24]. Team count/date/attachment confirmation; six visible email rows

C21 Observed feedback and team confirmation

The supplied chats show interest in trying the product, a preference for named responsibility, conditional acceptance of RMB39/month, and requests for automatic notifications and shared updates. The materials contain no completed purchase, deposit, agreed pilot or observed product trial. No-reply institutional contacts remain pending rather than classified as rejections.

Basis: [18, 19, 20, 21, 23]. Visible chat responses and owner-reported institutional outcome

C22 Outreach scope and selected evidence

For the requirement to make at least ten commercial offers, the team reports ten organisational product-experience invitations. The report presents a selected email-list screenshot rather than reproducing all correspondence. The eight individual consultations are recorded separately and are not automatically counted as eight additional commercial offers.

Basis: [13, 22, 23, 24]. Course requirement compared with invitation content and available proof

C23 Evidence limitation

The functional evidence covers controlled local scenarios and a local browser. It does not establish cross-device delivery, real accounts, reliability in service, clinical effects or live billing.

Basis: [4, 5, 6]. Experiment scope and local implementation boundary

C24 Observed fact

The course requires one team submission, a report of no more than 20 pages excluding the appendix, and a seven-minute presentation in four prescribed parts. The supplied final instructions do not state a calendar deadline.

Basis: [1]. Report and presentation requirements

C25 Owner-provided identity information

The page-one team roster is Group6 with the eight names and student numbers shown.

Basis: [2]. members array. Supplied by the project owner; not independently verified against university records.

C26 Scenario assumptions

The model input table uses service/support/AI 12, five free families at 0.50, processing 1%, churn 4%, acquisition 80, fixed operations 30000 and 800 paying families.

Basis: [10]. assumptions object. These are not measured customer data or supplier quotations.

C27 Evidence limitation

No completed outside-user task observation or timed speaking rehearsal is included in the report evidence. The six-minute-thirty-second presentation schedule is a plan.

Basis: [4, 6]. Scope of experiment and browser records. The speaker schedule is a future rehearsal aid, not a measured result.

C28 Observed feedback and team confirmation

The proposed tiers address different needs. Plus at RMB 39/month supports everyday responsibility, multiple plans and report export. Pro 5x at RMB 79/month adds rota, backups, handovers and adjustable follow-up. Pro 20x at RMB 99/month retains the same Pro care features and adds 300 generations for RMB 20 more per month. One contact conditionally accepts RMB39/month if the service is reliable and used regularly; this does not establish a paid conversion.

Basis: [5, 15, 19]. Plan rules and conditional price response

C29 Verified local allowance rules

Plus provides 20 successful local generations per monthly cycle, Pro 5x 100 and Pro 20x 400. All roles and recipients in a household share the counter. Each new successful generation, including regeneration, costs one use; failed, cancelled or invalid requests cost zero. Reading or saving an existing draft and exporting a care report cost zero. Unused allowance does not roll over. Plan changes preserve usage, while a new monthly demo cycle resets it and retains past drafts. Annual totals equal ten monthly fees but do not multiply the monthly allowance.

Basis: [5, 15, 16]. generate, nextCycle, activate and resetPurchase; Q01-Q06 in value-checks.json

C30 Recorded implementation experiment

Fifteen additional automated checks recorded on 20 September 2026 cover nine scenario steps and six allowance contracts. All passed. The examples execute the same local product rules in isolated sample households. These checks supplement the original twelve experiments; they are not customer participants or evidence of willingness to pay.

Basis: [15, 16]. 15 results and source hashes in value-checks.json

C31 Thematic summary with limited attribution

The team-prepared feedback document contains eight bilingual question-and-answer themes, not a response-by-person dataset. It covers willingness to try, responsibility, ease of use, price, free evaluation, privacy, target households and proposed features. Four chat screenshots support selected themes; individual-level percentages cannot be calculated from this material.

Basis: [17, 18, 19, 20, 21]. Eight numbered topics and four screenshots

C32 Method and exclusion rule

Earlier ten-record course simulations, including the four-interested, four-declined and two-pending split, are archived separately. They contribute zero contacts, responses or commitments to this updated actual-outreach account.

Basis: [11, 24]. Archived content file and current register

C33 Visible email greeting examples

The email-list preview includes greetings to Taikang Home, Xinrong Linbang and Xiaode Zhi-neng. These examples identify the intended addressee in the message greeting; the screenshot does not independently establish the mailbox’s organisational ownership, delivery or a partnership. All ten institutional contacts remain without a reported reply as of 22 September.

Basis: [22, 24]. Email-list rows 4–6; named examples in the current register

B Source inventory and product evidence

The source catalogue retains the original evidence identifiers S01–S13. Course instructions and the earlier notice are supplied sources [1, 13]; the team decisions and reported course convention are documented separately [2]. Product images and the tested rules support implementation claims [3, 5, 7]. Recorded experiments and their reproduction procedure support the functional results [4, 12]. The browser observation, preview and downloaded report can be compared directly [6, 8, 9]. The economics scenario and course outreach register retain their stated assumptions and provenance [10, 11].

Local evidence package: `evidence/browser-observations.json`. Local browser observations and report-download comparison. Identifies dates, actions, counts and limitations.
- [7] *S07 Current working household screenshot.*
Local evidence package: `evidence/current-workspace.png`. Retained screenshot of the working care desk from the 20 September 2026 local demonstration. Course scenario records; no outside user is shown.
- [8] *S08 Captured report preview.*
Local evidence package: `evidence/report-preview.txt`. Text read directly from the actual report preview on 20 September 2026; compare with the downloaded file S09.
- [9] *S09 Downloaded care report.*
Local evidence package: `evidence/downloaded-report-example.txt`. Actual downloaded local report from the course demonstration. It is not a medical record.
- [10] *S10 Illustrative economics scenario.*
Local evidence package: `evidence/economics-scenario.json`. Reproducible arithmetic from explicit assumptions. Neither cost quotes nor observed customer behaviour.
- [11] *S11 Customer offers and course outreach register.*
Local evidence package: `evidence/course-records-archive.js`. Archived 20 September course exercise. Synthetic contact identities and responses are excluded from the actual outreach and current commitment counts.

- [12] *S12 Functional experiment reproduction procedure.*
Local evidence package: `evidence/run-functional-experiments.cjs`. Run with Node.js to reproduce experiments against the supplied source snapshot. Results go to evidence-rerun.
- [13] *S13 Earlier course announcement.*
Local evidence package: `evidence/earlier-course-notice.jpg`. Original owner-supplied course announcement requiring at least ten real offers and an outreach record.
- [14] *S14 Fresh care workspace capture.*
Local evidence package: `evidence/current-workspace-hd.jpg`. Actual existing local workspace, recaptured on 20 September 2026 at 1180 by 1000 pixels. No record changes. The report and slides crop and enlarge the open care item; the complete capture is retained here.
- [15] *S15 Additional scenario and allowance verification.*
Local evidence package: `evidence/value-checks.json`. Fifteen recorded automated checks: nine care-scenario steps and six allowance contracts. Local controlled fixtures, no external participants; original experiment records remain unchanged.
- [16] *S16 Scenario and allowance reproduction procedure.*
Local evidence package: `evidence/run-value-checks.cjs`. Reproduces the checks against product-core.js and plan-value.js. The default output goes to evidence-rerun; it does not change browser records or send messages.
- [17] *S17 Team-prepared feedback summary.*
Local evidence package: `evidence/outreach-20260922/feedback-questions-answers.docx`. Eight bilingual question-and-answer themes supplied by the team. Chinese answers are labelled examples in the document; it is a thematic summary, not eight individually attributed transcripts.
- [18] *S18 Chat evidence: responsibility.*
Local evidence package: `evidence/outreach-20260922/chat-responsibility.png`. Product PDF shared; contact prioritises named responsibility. A 20:11 marker is visible, with no calendar date. Consultation range is confirmed separately in S23.
- [19] *S19 Chat evidence: price.*
Local evidence package: `evidence/outreach-20260922/chat-price.png`. Product PDF and RMB39/month question visible. Acceptance is conditional on reliability and regular use; simple reminders could feel expensive. A 20:18 marker is visible, no calendar date.
- [20] *S20 Chat evidence: proposed features.*
Local evidence package: `evidence/outreach-20260922/chat-notifications.png`. Contact requests automatic notifications and shared current updates. A 20:21 marker is visible, no calendar date. These features remain proposed.
- [21] *S21 Chat evidence: interest and target users.*
Local evidence package: `evidence/outreach-20260922/chat-trial.png`. Contact expresses willingness to try and identifies households with parents living alone, distant children or shared caregiving. A 20:29 marker is visible, no calendar date.
- [22] *S22 Email-list screenshot.*
Local evidence package: `evidence/outreach-20260922/email-list.png`. Six email-list rows with product-experience invitation subjects are visible. Greeting examples include Taikang Home, Xinrong Linbang and Xiaode Zhineng. This is a representative selection from the ten-organisation campaign, not the full correspondence archive.
- [23] *S23 Team confirmation on outreach.*
Local evidence package: `evidence/outreach-20260922/team-confirmation.json`. Owner confirms eight individuals consulted on 20–22 September 2026 and ten organisations emailed on 20 September with MVP video and product PDF; no institutional replies reported by 22 September.

[24] *S24 Current outreach register.*

Local evidence package: `evidence/outreach-register-2026-09-22.json`. 18 separate entries: eight consultations and ten organisation emails. The displayed screenshots are representative selections. Individual discussions are not automatically counted as commercial offers.

B.1 Report generated from the care scenario

The extract below retains the original downloaded output [9]. The complete file and its independently captured preview are supplied as S09 and S08 [8]. Original wording is preserved so the evidence can still be compared with its recorded hash.

SLIVER CARE · LOCAL CARE REPORT

Fictional classroom data · not a medical record

Demo clock: 2026-09-15 08:15

Activity period: last 7 demo days

Open items include all saved dates, including earlier reminders.

Scope: All saved demo profiles

Plan: Pro 5x

Reminders started: 2

Self-reported check-ins: 0

Family follow-ups recorded: 1

Currently open (all saved dates): 1

Help requests recorded: 1

CARE ITEMS STARTED IN THIS PERIOD

Margaret | Morning check-in | Follow-up recorded | Responsible: Alex

Robert | Lunch check-in | Family follow-up needed | Responsible: Alex

FOLLOW-UP NOTES AND EVENTS IN THIS PERIOD

2026-09-15 08:00 | Margaret | Morning check-in | Reminder started: Morning check-in

2026-09-15 08:00 | Margaret | Morning check-in | Help requested in this local demo. No message was sent.

2026-09-15 08:00 | Margaret | Morning check-in | Fictional demo: Alex called Margaret, recorded her request and agreed to follow up after lunch.

2026-09-15 08:00 | Robert | Reminder plan saved: Lunch check-in

2026-09-15 08:00 | Robert | Lunch check-in | Reminder started: Lunch check-in

2026-09-15 08:15 | Robert | Lunch check-in | A follow-up reminder is shown locally.

2026-09-15 08:15 | Robert | Lunch check-in | No response recorded; family follow-up is needed.

2026-09-15 08:15 | Robert | Lunch check-in | Fictional demo: Alex will contact Robert after the planned follow-up.

PRO · RECIPIENT OVERVIEW

Margaret: 1 started, 0 check-ins, 1 follow-up outcomes in this period; 0 currently open across all saved dates.

Robert: 1 started, 0 check-ins, 0 follow-up outcomes in this period; 1 currently open across all saved dates.

PRO · HANDOVERS IN THIS PERIOD

Jamie → Alex: Fictional demo: Alex will contact Robert after the planned follow-up.

PRO · DAILY ACTIVITY IN THIS ROLLING PERIOD

Date | reminders started | check-in events | follow-up outcomes

2026-09-08 | 0 | 0 | 0

Source file: `evidence/downloaded-report-example.txt`. SHA-256: `fe726bafd2bde3646737bd1b0d684e43be9bc1062632005115084f1fb53d0cb3`.

C Recorded experiments

Recorded at 2026-09-20T09:39:18.771Z. Executor: Automated local harness run by the coding assistant. Functional experiments using fictional, in-memory care data. No customer participation, medical validation or market testing.[4]

Twelve experiment cases passed. Counts refer to automated cases, not participants. The two rejected-rule comparisons are reconstructions performed in this run, not claimed historical measurements.

C.1 E01 PASS

Belief: The core follow-up works on Free.

Action: Start one reminder, request help, and save a fictional outcome.

Observed:

```
{"careItems": 1, "followUpOutcomes": 1, "actualContacts": 0}
```

C.2 E02 PASS

Belief: A Plus report includes the entered outcome.

Action: Confirm Free report gating, simulate Plus, then generate a report.

Observed:

```
{"reportContainsEnteredNote": true, "aiUsage": 0, "actualCharge": 0}
```

C.3 E03 PASS

Belief: Failure, cancellation and duplicate checkout preserve account state.

Action: Attempt failure and cancel, then complete the same order twice.

Observed:

```
{"savedOrders": 1, "quotedAnnualTotal": 390, "actualCharge": 0}
```

C.4 E04 PASS

Belief: Annual totals match the confirmed catalogue.

Action: Activate each paid annual plan in a fresh fixture.

Observed:

```
[{"plan": "plus", "total": 390, "actualCharge": 0}, {"plan": "pro5", "total": 790, "actualCharge": 0}, {"plan": "pro20", "total": 990, "actualCharge": 0}]
```

C.5 E05 PASS

Belief: AI limits cannot prevent the basic care response.

Action: Consume Plus allowance, reject an extra generation, then record a check-in.

Observed:

```
{"usedGenerations": 20, "excessGenerationRejected": true, "careResponse": "confirmed"}
```

C.6 E06 PASS

Belief: Pro backup and handover update responsibility.

Action: Configure 10/25-minute rules, advance 25 minutes, then hand back with a note.

Observed:

```
{"backupTookOver": true, "recordedHandovers": 1}
```

C.7 E07 PASS

Belief: Downgrade preserves records and current-cycle usage.

Action: Generate one result, downgrade, then record an outcome.

Observed:

```
{"plan": "free", "used": 1, "retainedResults": 1, "outcome": "resolved"}
```

C.8 E08 PASS

Belief: Earlier open work remains visible in a seven-day report.

Action: Leave one reminder open and advance eight demo days.

Observed:

```
{"reconstructedRejectedPeriodOnlyRule": 0, "currentOpenCount": 1, "fixtureDaysAdvanced": 8, "baselineIsReconstruction": true}
```

C.9 E09 PASS

Belief: A new outcome on an old reminder counts in the current period.

Action: Resolve the eight-day-old reminder and inspect one-day activity.

Observed:

```
{"oneDayFollowUpCount": 1, "currentlyOpen": 0}
```

C.10 E10 PASS

Belief: Care reset preserves outreach and unsent request records.

Action: Use one in-memory synthetic outreach fixture and one request, then reset care.

Observed:

```
{"reconstructedFullReplacementRetains": 0, "currentResetRetains": 1, "unsentRequestsRetained": 1, "fixtureNeverWrittenToBrowser": true}
```

C.11 E11 PASS

Belief: Cross-midnight scheduling uses the due-date rota.

Action: Set a dated rota and evening reminder, then advance 24 hours.

Observed:

```
{"dueAt": "2026-09-15T18:00:00.000Z", "ownerMatchesDueDateRota": true}
```

C.12 E12 PASS

Belief: Invalid backup data cannot create a charged demo order.

Action: Tamper with actualCharge on a simulated receipt and validate.

Observed:

```
{"tamperedBackupRejected": true}
```

Reproduction: `node evidence/run-functional-experiments.cjs`. The procedure reads the included source snapshot and writes results to `evidence-rerun` [12]. It does not modify browser records or send messages.

C.13 Additional scenario and allowance checks

Fifteen additional automated checks cover the nine visible steps across the three care examples and six metering contracts. All passed; the dated record includes observations and source hashes [15]. Run `node evidence/run-value-checks.cjs` against the included `product-core.js` and `plan-value.js` to reproduce them [16]. Output goes to `evidence-rerun`. These controlled examples do not modify saved browser records or establish customer demand.

D Presentation and submission checks

The planned presentation route is listed in table 9. It is a schedule for rehearsal, not a measured speaking result.^[C27]

Table 9: Presentation route within the seven-minute limit

Part	Planned time	Evidence or action
1 Where we are	0:00–0:50	Speaker 1: Group6, intended family users and local MVP stage
2 Evidence and commitment	0:50–2:35	Speaker 2: prototype, functional checks, eight consultations and ten organisation invitations
3 Product demonstration	2:35–5:15	Speaker 3: pre-activated simulated Plus; save an outcome and export it; proposed price and limits
4 Next steps	5:15–6:30	Speaker 4: stop due to team capacity; archive, review and remain inactive over 90 days
Buffer	6:30–7:00	Finish before the hard stop; questions follow

A designated presenter is allowed for an in-class presentation. If exempt from attendance, the course instead requires a seven-minute recording in which everyone appears and speaks [1].

Only one submission per group is required. Submit the final report as PDF or Word through Blackboard. Group6 and all eight member names and student numbers appear on page one. The main report must remain within the 20-page cap, with supporting material in the appendix. No calendar deadline was supplied; verify it on Blackboard. Submission remains the team’s responsibility [1].

E Actual outreach evidence

The team confirms eight individual consultations on 20–22 September and ten organisational emails on 20 September 2026, with no organisational reply by 22 September [23, 24]. The full register records the target alias, date coverage, offer, outcome, experience and next step. The report deliberately presents representative excerpts rather than every conversation and email. Previous fictional examples are excluded. The supplied chat and mail images are reproduced in figures 2 to 6.

E.1 Feedback themes and traceability

Willingness to try. A contact expressed willingness to try because families cannot always know how a parent living alone is doing. This is stated interest, not observed trial participation.[21, 17]

Responsibility. A contact prioritised a named responsible person because relatives may each assume somebody else will act. A qualitative account, not a measured reduction in missed care.[18, 17]

Ease of use. The team summary asks for large buttons, few steps and simple completed/help choices. This theme is summarised in S17; it is not an observed older-adult task-performance result.[17]

Price. One contact said RMB39/month could be acceptable with reliable, regular use, but simple reminders alone could feel expensive. Conditional price feedback, not a payment commitment.[19, 17]

Free evaluation. The summary favours trying the tool first to see whether the older person will use it and communication improves. No completed trial or retention observation supplied.[17]

Privacy. The summary identifies privacy and access to family information as concerns. The local demo does not establish production security.[17]

Intended households. A contact highlighted parents living alone, children in other cities and several relatives sharing care. No representative sample or prevalence estimate.[21, 17]

Notifications and shared updates. A contact requested notification of a designated family member after no response and simultaneous updates for relatives. Neither capability is connected in the current local MVP.[20, 17]

E.2 Outreach register and completion of the offer requirement

Ten organisational product-experience invitations were reported sent. Four chat records and one email-list image were selected to demonstrate the outreach without reproducing the entire archive. Eight personal consultations are tracked separately and are not automatically counted as eight commercial offers. Visible greeting examples include Taikang Home, Xinrong Linbang and Xiaode Zhineng; these are outreach examples, not responding partners.[13, 22, 23, 24] The eight personal consultation records and ten organisational entries, including notes and next actions, are supplied in `downloads/Sliver_Care_Outreach_Records.csv` and source S24. Dates describe the outreach campaign. Individual transcripts and email rows are reproduced selectively to keep this report concise; their omission from the displayed selection does not mean those contacts lack records.

Figure 2: Product PDF shared; contact prioritises named responsibility. A 20:11 marker is visible, with no calendar date. Consultation range is confirmed separately in S23. Source S18 [18].

Figure 3: Product PDF and RMB39/month question visible. Acceptance is conditional on reliability and regular use; simple reminders could feel expensive. A 20:18 marker is visible, no calendar date. Source S19 [19].

Figure 4: Contact requests automatic notifications and shared current updates. A 20:21 marker is visible, no calendar date. These features remain proposed. Source S20 [20].

Figure 5: Contact expresses willingness to try and identifies households with parents living alone, distant children or shared caregiving. A 20:29 marker is visible, no calendar date. Source S21 [21].

Figure 6: Six email-list rows with product experience invitation subjects are visible. Representative email-list excerpt selected for brevity. Examples include Taikang Home, Xinrong Linbang and Xiaode Zhineng. The campaign covered ten organisations. Source S22 [22].
